Parallelism: why bother?

Moore's Law (1965)

"The number of transistors in a dense integrated circuit doubles every two years"

https://ourworldindata.org/grapher/transistors-per-microprocessor

Parallelism: why bother?

Number of cycles a CPU executes per second

The speed at which a single CPU can process instructions has remained the same since the early 2000s!

This one was sold ~ 1 year ago for $80

2021-11-17 10:25:52

Parallelism: the shift to multi-core architectures

48 years of Microprocessors Trend Data

https://zenodo.org/record/3947824#.YYrKHlNMH0p

Onset of multi-core architecture

2021-11-17 10:27:10

Computer Programs: Instructions blocks

A computer program is a sequence of **blocks of instructions**:

"Do this on that, and then..."

TASKS DATA

Instructions within a block *can* be executed in **parallel**

...

Different blocks are executed **sequentially**

Computer Programs: Data & Task parallelism

- An instruction is a pair (TASK, DATA)
- There are two "pure" ways of executing instructions in parallel:

Task Parallelism

Execute different tasks over the same data

Data Parallelism

Execute the same task over different chunks of data

Performance: Terminology

Jargon	Description
Peak performance	Maximum speed at which the computer can operate
Clock rate (GHz)	Unit of measure of a processor's speed, reflecting the natural clock rate at which it can operate
Computer cycle	Shortest time in which a unit of work can be performed
Instructions per second	How quickly the computer can issue instructions (e.g. memory reads/writes, logical operations, floating point operations, integer operations, branch instructions)
FLOPS	Floating point operations per second (e.g. subtract, add, divide, multiply)
Speedup	Measures the benefit of parallelism, showing how a program scales as more processors are employed
Benchmark	Used to rate and compare performance of parallel computers (see Top500 Supercomputers)

Parallel Computers: Processing Units

Moderate number of powerful processors

Large number of moderate processors

The usual setup these days…

https://blogs.nvidia.com/blog/2009/12/16/whats-the-difference-between-a-cpu-and-a-gpu/

2021-11-17 10:36:07

Parallel Computers: Memory

Distributed Memory

Shared Memory

Distributed Shared Memory

2021-11-17 10:37:55

Parallel Computers: Flow of Control

Flynn's Taxonomy

Describes how streams of **instructions** interact with streams of **data**

Instruction Streams	Data Streams: Single	Data Streams: Multiple
Single	SISD	SIMD
Multiple	MISD	MIMD

2021-11-17 10:40:13

Parallel Computers: Flow of Control

Flynn's Taxonomy

Describes how streams of **instructions** interact with streams of **data**

Instruction Streams \ Data Streams	Single	Multiple
Single	SISD	SIMD
Multiple	MISD	MIMD

SISD is naturally not parallelizable…

- Personal computers until ~2010

2021-11-17 10:40:35

Parallel Computers: Flow of Control

Flynn's Taxonomy

Describes how streams of **instructions** interact with streams of **data**

Instruction Streams	Data Streams: Single	Data Streams: Multiple
Single	SISD	SIMD
Multiple	MISD	MIMD

SIMD is parallelizable: it can **scale**

- Array (vector) processors: AVX (e.g. Intel Knights Landing, AMD Bulldozer)

2021-11-17 10:41:15

Parallel Computers: Flow of Control

Flynn's Taxonomy

Describes how streams of **instructions** interact with streams of **data**

Instruction Streams \ Data Streams	Single	Multiple
Single	SISD	SIMD
Multiple	MISD	MIMD

MISD is parallelizable: it can **scale**, but it is not very common

- Generally used for fault tolerance (e.g. NASA Space Shuttle flight control computer)

2021-11-17 10:41:49

Parallel Computers: Flow of Control

Flynn's Taxonomy

Describes how streams of **instructions** interact with streams of **data**

Instruction Streams	Data Streams: Single	Data Streams: Multiple
Single	SISD	SIMD
Multiple	MISD	MIMD

MIMD is highly parallelizable: it can **scale** either way

- Every supercomputer on Top500 since 2010

https://en.wikipedia.org/wiki/Flynn%27s_taxonomy

2021-11-17 10:43:07

Parallel Computers: Interconnection Networks

Platform, wires and cables that define how multiple processors are connected to each other and to the memory units

Network Characteristics

Diameter: maximum distance that data must travel for two processors to communicate

Bandwidth: amount of data that can be sent through the network within a certain time

Latency: delay on a network while a data packet is being stored and forwarded

Degree: number of communicating wires coming out of each processor

Topology: configuration of the network that determines how processors are connected

Atlas @ Lawrence Livermore National Laboratory
1142 nodes
192 24-port InfiniBand SDR
3-staged folded Clos topology

Jaguar Cray XT-5 partition @ Oak Ridge National Lab
18851 nodes
SeaStar 2 25x32x24 3D-Torus

http://unixer.de/research/topologies/

2021-11-17 10:43:42

Processes, Threads and more

Thread: smallest sequence of instructions that the OS scheduler can manage

Process: composed of threads. Memory space allocated when program is loaded from disk.

2021-11-17 10:44:51

2021-11-17 10:47:34

Why OpenMP?

OpenMP

"OpenMP (Open Multi-Processing) is an application programming interface (API) that supports multi-platform shared memory multiprocessing programming in C, C++, and Fortran."

https://www.openmp.org/

- Compiler directives
- Library routines
- Environment variables

Application runtime behavior

- Simple, robust, mature framework
- Incorporated into every major compiler
- Incremental parallelism
- Does not require message passing
- Allows for reasonable speedups with very little work

- Not fully scalable by itself
- Does not require redesigning or creating new applications within the parallel computing paradigm
- Performance usually limited by sequential blocks

2021-11-17 10:50:57

Press esc to exit full screen

Parallel Regions

These are blocks of code where instructions can be executed independently by different threads

Other names for **Thread 0**:

- Main
- Parent
- Manager

A team of threads is created at the beginning of the parallel region, and we distribute instructions to each of them

As threads finish their instructions, they **wait at the end of the region until the entire team is done**. The team is then destroyed, and the next block is executed

Parallel Regions with OpenMP: Syntax

C/C++

```
#include "omp.h"
.
.
... serial code ...
.
.
#pragma omp parallel
{
    ... instructions ...
}
.
.
... serial code ...
.
.
```

Fortran

```
use :: omp_lib
.
.
... serial code ...
.
.
!$omp parallel
   .
    ... instructions ...
   .
!$omp end parallel
.
.
... serial code ...
.
.
```

2021-11-17 10:55:45

Parallel Regions with OpenMP: Syntax

OpenMP library header

OpenMP **parallel** directive

PARALLEL BLOCKS

C/C++

```
#include "omp.h"
.
.
... serial code ...
.
.
#pragma omp parallel
{
    ... instructions ...
}
.
... serial code ...
.
.
```

Fortran

```
use :: omp_lib
.
.
... serial code ...
.
.
!$omp parallel
    .
    ... instructions ...
    .
!$omp end parallel
.
.
... serial code ...

    }
    return 0;
}
```

2021-11-17 11:05:10

Compilation of parallel code (OpenMP)

The general syntax for compilation is:

```
compiler –[OpenMP flag] <SourceCode> -o <TargetBinary>
```

For the current example:

```
g++ -fopenmp hello_omp.cpp –o hello_omp.exe
```

Compiler	OpenMP flag
GCC	-fopenmp
Intel	-qopenmp
AOCC	-fopenmp

Programming Language	OpenMP Header
C/C++	#include "omp.h"
Fortran	use :: omp_lib

ILLINOIS NCSA

Execution of parallel applications (OpenMP)

The number of threads that are invoked in a parallel region (the size of the team) is controlled by the **OMP_NUM_THREADS**

Before executing your application, use **export** to set it to the desired number:

```
export OMP_NUM_THREADS=N
```

And then finally run the application:

```
./<TargetBinary>
```

        }
    }
}
gettimeofday(&stop_time, NULL);                    // stop clock
```

Parallel Block

STATS: Parallelized code

Find the code here: https://github.com/babreu-ncsa/IntroToPC/blob/main/stats/omp/stats_omp.cpp

What about the implementation of each function?

```
void get_vec_min(const vector<double> &v)
{
    double min;
    min = v[0];
    for (int i = 1; i < v.size(); i++)
    {
        if (v[i] < min)
            min = v[i];
    }
    cout << scientific;
    cout << "Min of vector: " << min << endl;
}
```

```
void get_vec_max(const vector<double> &v)
{
    double max;
    max = v[0];
    for (int i = 1; i < v.size(); i++)
    {
        if (v[i] > max)
            max = v[i];
    }
    cout << scientific;
    cout << "Max of vector: " << max << endl;
}
```

```
void get_vec_avg(const vector<double> &v)
{
    double sum;
    sum = v[0];
    for (int i = 1; i < v.size(); i++)
    {
        sum += v[i];
    }
    cout << scientific;
    cout << "Avg of vector: " << sum / v.size() << endl;
}
```

They remain the same!

sbatch stats.jobscript
```

- **To check status:**

```
squeue -u $USER
```

Use `cat` to check on your output, copy it and paste in the chat!

The output file should be named like:

statsYourJobID.out

The tab button will help you find it!

STATS: Measuring performance

Raw time measurements are not very helpful…

Number of threads	Elapsed time (s)
1	1.32492
2	0.86940
3	0.57525
4	0.58531
5	0.49785
6	0.49656

2021-11-17 11:28:02

STATS: Measuring performance

A better measure is how much faster the code runs in parallel when compared to when it runs serially:

$$\frac{t_1}{t_N}$$

one thread

multiple threads

Number of threads	Elapsed time (s)	t_1 / t_N
1	1.32492	1.000
2	0.86940	1.524
3	0.57525	2.303
4	0.58531	2.264
5	0.49785	2.661
6	0.49656	2.668

2021-11-17 11:28:21

STATS: Measuring performance

A better measure is how much faster the code runs in parallel when compared to when it runs serially:

$$\frac{t_1}{t_N}$$

one thread

multiple threads

Data Parallelism

Data Parallelism

Execute the same task over different chunks of data

2021-11-17 11:35:29

OpenMP parallel loops: Syntax

OpenMP library header

OpenMP parallel directives

C/C++

```
#include "omp.h"
.
.
... serial code ...
.
.
#pragma omp parallel
{
    #pragma omp for
    for(int i = 0; i < N; i++)
    {
        ... task ...
    }
}
.
.
... serial code ...
.
.
```

Fortran

```
use :: omp_lib
.
.
... serial code ...
.
.
!$omp parallel
    !$omp do
    do i = 1, N
        .
        ... task ...
        .
    enddo
    !$omp end do
!$omp end parallel
.
.
... serial code ...
.
.
```

OpenMP **do/for**

Loop implementation must follow!

SAXPY: Performance analysis

Threads are not much different from people...

This is called the **Ringelmann effect**

Losses generally come from:

- More complex management requirements
- Increased communication requirements
- Task conflicts

In parallel computing language, this is called **parallel overhead**

- Creating, distributing workloads and destroying a larger number of threads simply takes longer!

BUT...

SAXPY: Performance analysis

Parallel overhead is not that much of a problem here…

SAXPY: Performance analysis

Parallel overhead is not that much of a problem here…

Each **thread** is usually associated to a certain **CPU** (thread affinity)

2021-11-17 11:54:24

SAXPY: Performance analysis

We start the code by allocating two vectors, **x** and **y**, with 2^{27} entries each…

Multi-core processor

Which is only about 1 GB out a total of 256 GB!

2021-11-17 11:54:45

SAXPY: Performance analysis

Multi-core processor

Maximum distance that a thread needs to travel to access memory address

N = 2 Threads

2021-11-17 11:55:15

SAXPY: Performance analysis

Multi-core processor

Maximum distance that a thread needs to travel to access memory address

N = 6 Threads

2021-11-17 11:55:22

SAXPY: Performance analysis

Multi-core processor

Maximum distance that a thread needs to travel to access memory address

N = 10 Threads

Ideal scaling requires problem scaling as well!

Summary

Parallel computing is essential for modern scientific research computing

Computers today execute multiple instructions on multiple pieces of data (MIMD)

OpenMP allows for incremental parallelization with very simple directives

Using Task Parallelism, we improved the performance of the STATS application by 2.4x

Using Data Parallelism, we improved the performance of the SAXPY application by 8x
